

## PRESS RELEASE

### **HPE Proliant Gen9 server as managed server or managed hosting solution**

**Düsseldorf, 25 January 2017.** myLoc managed IT AG offers dedicated servers based on HPE Proliant Gen9 servers. These servers are provided with the new processor generation of Intel XEON E3 v5 CPUs or other strong XEON E5 hardware. The processor technology based on Skylake offers, apart from increased performance and energy efficiency, the great advantage that DDR4 main memory with up to 384 GB can be utilized.

Users can now purchase dedicated managed servers at the price of a dedicated server. The managed server functions allow our customers to concentrate on their core business and manage their server via a web interface only. With the pre-installed software Plesk Obsidian, users are able to create their email accounts for their company, administer and manage your website with the free Wordpress toolkit and install daily software packages. In addition to an optional pre-installed hardware RAID hard disk system, data security is guaranteed by daily and automated backups, which are within the responsibility of myLoc managed IT AG. With the help of our Managed Security Package, which is included in the price, your server is protected against attacks like SPAM, viruses or DDOS and a lot of other external attacks. Due to these included features the managed servers are perfectly suitable for the IT department of companies.

If the managed server offers are not sufficient, it is recommended to see into the managed hosting area. Here, individual managed hosting solutions can be created in cooperation with the sales and technical departments of myLoc managed IT AG. The dedicated servers of a managed hosting solution are configured and pre-installed according to the user's requirements. Interested parties can determine the configuration and installed software for their managed hosting environment themselves in consultation with their IT department. All managed hosting solutions benefit from the excellent data centre infrastructure and are air-conditioned by means of a specially designed cold-warm aisle system. A separate data centre area has been expanded just for managed hosting and is equipped with redundant UPS systems, emergency power supply systems, an argon gas extinguishing system and of course high-performance air conditioning systems.
